The position of the center of mass should be treated quantum mechanically.

q - position operator for N particle soliton.

The effective Hamiltonian

If we add weak disorder potential V(z), the effective Hamiltonian describing center of mass motion reads:

$$\hat{H}_{\mathrm{eff}} pprox rac{p^2}{2N} + \int dz \ V(z) \ |\phi_0(z-q)|^2 \,.$$

Simple arguments:

Substitution of a time-dependent bright soliton solution $\sim e^{ipz}\phi_0(z-q)$ to the energy functional

$$E = \int dz \left[\frac{1}{2} |\partial_z \phi|^2 + \frac{g}{2} |\phi|^4 - \mu |\phi|^2 + \frac{V(z)}{|\phi|^2} \right] = \frac{p^2}{2N} + \int dz V |\phi_0(z-q)|^2$$

Many-body approach to Anderson localization

Any many body effect omitted in the former effective CM quantization approach could destroy the phase coherence and the wavefunction.

Need for a full many body test

$$\hat{H} = \int dz \; \hat{\psi}^{\dagger}(z) \left[-\frac{1}{2} \; \frac{\partial^2}{\partial z^2} + V(z) \right] \hat{\psi}(z) + \frac{g}{2} \int dz \; \hat{\psi}^{\dagger}(z) \; \hat{\psi}^{\dagger}(z) \; \hat{\psi}(z) \; \hat{\psi}(z) \; \hat{\psi}(z)$$

Discretization (3-point kinetic energy) gives Bose-Hubbard Hamiltonian:

$$H = \sum_{l} \left[-J(a_{l}^{\dagger}a_{l+1} + h.c.) + \frac{U}{2}a_{l}^{\dagger}a_{l}^{\dagger}a_{l}a_{l} + V_{l}a_{l}^{\dagger}a_{l}\right]$$

 $J = rac{1}{2\delta^2}$, $U = rac{g}{\delta}$ and $V_l = V(z_l)$, $z_l = l\delta$

Many-body approach to Anderson localization Technicalities

- space restricted to 2K + 1 = 1921 points $[-K\delta, K\delta]$
- Matrix product state (MPS) cvariational representation

$$|\psi\rangle = \sum_{\alpha_1,\ldots,\alpha_M; \ i_1,\ldots,i_M} \Gamma_{1\alpha_1}^{[1],i_1} \lambda_{\alpha_1}^{[1]} \Gamma_{\alpha_1\alpha_2}^{[2],i_2} \ldots \Gamma_{\alpha_{n-1}1}^{[M],i_M} |i_1,\ldots,i_M\rangle$$

 $\Gamma^{[\mathit{I}],\mathit{i_{l}}}$ - site dependent tensors, $\lambda^{[\mathit{I}]}$ - bond vectors

- We find a quasi-exact many body ground state bright soliton in a shallow trap (imaginary time propagation TEBD)
- Trap is removed, disorder turned on, real time propagation with TEBD
- Reliable calculations for N = 25 particles

Many-body approach to Anderson localization Technicalities

- Unit of length soliton size ξ Unit of time ξ^2
- Initial harmonic oscillator $\omega = 0.025/\xi^2$ (not to disturb the soliton shape yet to confine CM to a distance slightly larger than ξ)
- strength of the random potential comparable to soliton energy $\omega/4$ i.e. $V_0=2.5\times 10^{-4}$
- correlation of the disorder $\sigma_0 = 0.4\xi$
- discretization $\delta = \xi/5$ tests on smaller...
- time step (Trotter errors!) $dt = 0.008\xi^2$
- $N_{max} = 14$ (needed!) despite $N\delta/2\xi = 2.5$ for N = 25
- $\chi = 30$ (small possible) dimension per site 450 (1921 sites)
